NUCLEOFILL

The new concept of skin bioregeneration

CE
0373

NUCLEOFILL

P O L I N U C L E O T I D E S G E L
MEDIUM 2% - STRONG 2,5%

is the new line of biostimulating gels based on natural high-viscosity *polynucleotides* for skin rejuvenation and protection.

A pure gel, highly viscoelastic, injectable, apyrogenic and totally resorbable.

Thanks to its biochemical characteristics, NucleoFill improves the elasticity of skin, is effective in anti-aging treatments such as wrinkle prevention, loss of skin turgor, tone and elasticity and for treating tissue atrophy.

The strong moisturizing capacity is mainly due to the ability to retain water at the structural nucleotide level

An electrostatic sponge able to guarantee cellular wellbeing

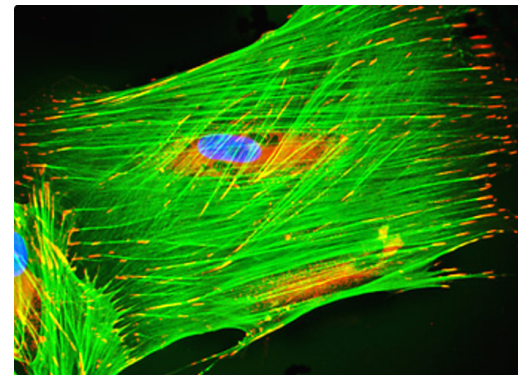

LIFTING AND SPECIFIC ANTI-AGE EFFECT

Polynucleotides activate two types of membrane receptors in fibroblasts, namely CD 39 receptors and CD 40 receptors. The activation of these two receptors leads to two effects:

- **Stimulation of type 1 collagen production**
- **Fibroblast maturation in myofibroblasts**

GYM-EFFECT

The maturation of fibroblasts in myofibroblasts and the production of collagen determines a **strong lifting** and **specific revitalizing effect** for all skin types.
